

BQ27427 具有集成检测电阻的系统侧 Impedance Track™ 电量监测计

1 特性

- 单节锂离子电池电量监测计
 - 驻留在系统主板上
 - 支持嵌入式或可拆除电池
 - 由具有集成 LDO 的电池直接供电
 - 集成低阻值检测电阻 (7mΩ)
- 超低功耗：正常模式下为 50μA，睡眠模式下为 9μA
- 基于获得专利的 Impedance Track™ 技术的电池电量监测
 - 为 4.2V、4.35V 和 4.4V 电池提供三种可选的预编程配置文件
 - 借助平滑滤波器报告剩余电量和荷电状态 (SOC)
 - 针对电池老化、自放电、温度和速率变化自动调节
 - 估计电池健康状况 (老化)
- 微控制器外设接口支持：
 - 400kHz I²C 串行接口
 - 可配置 SOC 中断或
 - 电池低电量数字输出警告
 - 内部温度传感器或主机报告的温度或外部热敏电阻

2 应用

- 智能手机、功能型手机和平板电脑
- 可穿戴设备
- 楼宇自动化
- 便携式医疗/工业手持终端
- 便携式音频设备
- 游戏

3 说明

德州仪器 (TI) BQ27427 电池电量监测计是一款单节电池电量监测计，只需进行少量的用户配置和系统微控制器固件开发工作即可快速启动系统。

通过对三种化学配置文件进行预编程，尽可能减少用户配置，并帮助客户管理项目中不同电池化学成分的库存。BQ27427 电池电量监测计在睡眠模式下具有超低功耗，有助于延长电池运行时间。可配置中断有助于节省系统功耗，释放主机使其停止继续轮询。外部热敏电阻为精确温度感测提供支持。

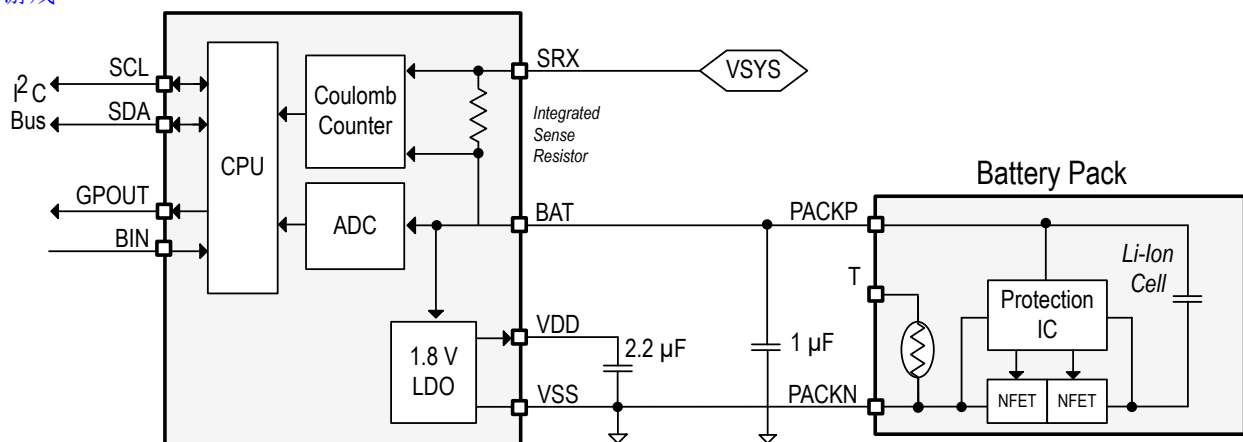

BQ27427 电池电量监测计使用已获专利的 Impedance Track™ 算法来进行电量监测，并提供诸如剩余电量 (mAh)、荷电状态 (%) 和电池电压 (mV) 等信息。

使用 BQ27427 电量监测计进行电池电量监测时，只需连接至可拆卸电池包或嵌入式电池电路的 PACK+ (P+) 和 PACK- (P-)。微型、9 球、1.62mm × 1.58mm、0.5mm 间距 NanoFree™ 芯片级封装 (DSBGA) 非常适合空间受限的应用。

器件信息

4 Pin Configuration and Functions

图 4-1. Top View

图 4-2. Bottom View

表 4-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NUMBER		
BAT	C3	PI, AI	LDO regulator input and battery voltage measurement input. Kelvin sense connect to positive battery terminal (PACKP). Connect a capacitor (1 μ F) between BAT and V_{SS} . Place the capacitor close to the gauge.
BIN	B1	DI	<p>Battery insertion detection input. If <i>OpConfig</i> [BI_PU_EN] = 1 (default), a logic low on the pin is detected as battery insertion. For a removable pack, the BIN pin can be connected to V_{SS} through a pulldown resistor on the pack, typically the 10-k Ω thermistor; the system board should use a 1.8-M Ω pullup resistor to V_{DD} to verify the BIN pin is high when a battery is removed. If the battery is embedded in the system, leave [BI_PU_EN] = 1 and use a 10-k Ω pulldown resistor from BIN to V_{SS}. If [BI_PU_EN] = 0, then the host must inform the gauge of battery insertion and removal with the <i>BAT_INSERT</i> and <i>BAT_REMOVE</i> subcommands.</p> <p>A 10-k Ω pulldown resistor should be placed between BIN and V_{SS}, even if this pin is unused.</p> <p>NOTE: The BIN pin must not be shorted directly to V_{CC} or V_{SS} and any pullup resistor on the BIN pin must be connected only to V_{DD} and not an external voltage rail. If an external thermistor is used for temperature input, the thermistor should be connected between this pin and V_{SS}.</p>

表 4-1. Pin Functions (续)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NUMBER		
GPOUT	A1	DO	This open-drain output can be configured to indicate BAT_LOW when the OpConfig [BATLOWEN] bit is set. By default [BATLOWEN] is cleared and this pin performs an interrupt function (SOC_INT) by pulsing for specific events, such as a change in state-of-charge. Signal polarity for these functions is controlled by the [GPIOPOL] configuration bit. This pin should not be left floating, even if unused; therefore, a 10-k Ω pullup resistor is recommended. If the device is in SHUTDOWN mode, toggling GPOUT will make the gauge exit SHUTDOWN. Connect GPOUT to a GPIO of the host MCU so that in case of any inadvertent shutdown condition, the gauge can be commanded to come out of SHUTDOWN.
SCL	A3	DIO	Peripheral I ² C serial bus for communication with system (primary). Open-drain pins. Use with external 10-k Ω pullup resistors (typical) for each pin. If the external pullup resistors are disconnected from these pins during normal operation, use external 1-M Ω pulldown resistors to V _{SS} at each pin to avoid floating inputs.
SDA	A2	DIO	
SRX	C2	AI	Integrated high-side sense resistor and coulomb counter input, connected between battery pack and system power rail VSYS.
V _{DD}	B3	PO	1.8-V regulator output. Decouple with 2.2- μ F ceramic capacitor to V _{SS} . This pin is not intended to provide power for other devices in the system.
V _{SS}	B2, C1	PI	Ground pin

(1) IO = Digital input-output, AI = Analog input, P = Power connection

5 Specifications

5.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _{BAT}	BAT pin input voltage range	- 0.3	6	V
V _{SRX}	SRX pin input voltage range	V _{BAT} - 0.3	V _{BAT} + 0.3	V
V _{DD}	V _{DD} pin supply voltage range (LDO output)	- 0.3	2	V
V _{IOD}	Open-drain IO pins (SDA, SCL)	- 0.3	6	V
V _{IOPP}	Push-pull IO pins (BIN)	- 0.3	V _{DD} + 0.3	V
T _A	Operating free-air temperature range	- 40	85	°C
Storage temperature, T _{stg}		- 65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

5.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1500	V
		Charged-device model (CDM), per JEDEC specification ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

T_A = 30°C and V_{REGIN} = V_{BAT} = 3.6 V (unless otherwise noted)

			MIN	NOM	MAX	UNIT
C _{BAT} ⁽¹⁾	External input capacitor for internal LDO between BAT and V _{SS}	Nominal capacitor values specified. Recommend a 5% ceramic X5R-type capacitor located close to the device.	0.1			μ F
C _{LDO18} ⁽¹⁾	External output capacitor for internal LDO between V _{DD} and V _{SS}		2.2			μ F
V _{PU} ⁽¹⁾	External pullup voltage for open-drain pins (SDA, SCL, GPOUT)		1.62		3.6	V

- (1) Specified by design. Not production tested.

5.4 Thermal Information

THERMAL METRIC ⁽¹⁾		BQ27427	UNIT
		YZF (DSBGA)	
		9 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	107.8	°C/W
R _{θJCTop}	Junction-to-case (top) thermal resistance	0.7	°C/W
R _{θJB}	Junction-to-board thermal resistance	60.4	°C/W
ψ _{JT}	Junction-to-top characterization parameter	3.5	°C/W
ψ _{JB}	Junction-to-board characterization parameter	60.4	°C/W
R _{θJCbot}	Junction-to-case (bottom) thermal resistance	NA	°C/W

- (1) For more information about traditional and new thermal metrics, see the [IC Package Thermal Metrics Application Report, SPRA953](#).

5.5 Supply Current

 $T_A = 30^\circ\text{C}$ and $V_{\text{REGIN}} = V_{\text{BAT}} = 3.6\text{ V}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{CC} ⁽¹⁾	NORMAL mode current		50		μA
I_{SLP} ⁽¹⁾	SLEEP mode current		9		μA
I_{SD} ⁽¹⁾	SHUTDOWN mode current		0.6		μA
	Fuel gauge in host commanded SHUTDOWN mode. (LDO regulator output disabled)				

(1) Specified by design. Not production tested.

(2) Wake Comparator Disabled.

5.6 Digital Input and Output DC Characteristics

 $T_A = -40^\circ\text{C}$ to 85°C , typical values at $T_A = 30^\circ\text{C}$ and $V_{\text{REGIN}} = 3.6\text{ V}$ (unless otherwise noted) ⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{\text{IH(OD)}}$	Input voltage, high ⁽²⁾	External pullup resistor to V_{PU}	$V_{\text{PU}} \times 0.7$		V
$V_{\text{IH(PP)}}$	Input voltage, high ⁽³⁾		1.4		V
V_{IL}	Input voltage, low ^{(2) (3)}			0.6	V
V_{OL}	Output voltage, low ⁽²⁾			0.6	V
I_{OH}	Output source current, high ⁽²⁾			0.5	mA
$I_{\text{OL(OD)}}$	Output sink current, low ⁽²⁾			-3	mA
C_{IN} ⁽¹⁾	Input capacitance ^{(2) (3)}			5	pF
I_{Ikg}	Input Leakage Current (SCL, SDA, BIN, GPOUT)			1	μA

(1) Specified by design. Not production tested.

(2) Open Drain pins: (SCL, SDA, GPOUT)

(3) Push-Pull pin: (BIN)

5.7 LDO Regulator, Wake-up, and Auto-Shutdown DC Characteristics

 $T_A = -40^\circ\text{C}$ to 85°C , typical values at $T_A = 30^\circ\text{C}$ and $V_{\text{REGIN}} = 3.6\text{ V}$ (unless otherwise noted) ⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{BAT}	BAT pin regulator input	2.45		4.5	V
V_{DD}	Regulator output voltage		1.85		V
$UVLO_{\text{IT+}}$	V_{BAT} undervoltage lock-out LDO wake-up rising threshold		2		V
$UVLO_{\text{IT-}}$	V_{BAT} undervoltage lock-out LDO auto-shutdown falling threshold		1.95		V
$V_{\text{WU+}}$ ⁽¹⁾	GPOUT (input) LDO Wake-up rising edge threshold ⁽²⁾	LDO Wake-up from SHUTDOWN mode	1.2		V

(1) Specified by design. Not production tested.

(2) If the device is commanded to SHUTDOWN via I²C with $V_{\text{BAT}} > UVLO_{\text{IT+}}$, a wake-up rising edge trigger is required on GPOUT.

5.8 LDO Regulator, Wake-up, and Auto-Shutdown AC Characteristics

 $T_A = -40^\circ\text{C}$ to 85°C , typical values at $T_A = 30^\circ\text{C}$ and $V_{\text{REGIN}} = 3.6\text{ V}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{SHDN} ⁽¹⁾	SHUTDOWN entry time			250	ms
t_{SHUP} ⁽¹⁾	SHUTDOWN GPOUT low time	10			μs
t_{VDD} ⁽¹⁾	Initial V_{DD} output delay		13		ms

5.8 LDO Regulator, Wake-up, and Auto-Shutdown AC Characteristics (续)

$T_A = -40^{\circ}\text{C}$ to 85°C , typical values at $T_A = 30^{\circ}\text{C}$ and $V_{\text{REGIN}} = 3.6\text{ V}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{WUVDD} ⁽¹⁾ Wake-up V_{DD} output delay	Time delay from rising edge of GPOUT (input) to nominal V_{DD} output		8		ms
t_{PUCD} Power-up communication delay	Time delay from rising edge of REGIN to the Active state. Includes firmware initialization time		250		ms

(1) Specified by design. Not production tested.

5.9 ADC (Temperature and Cell Measurement) Characteristics

$T_A = -40^{\circ}\text{C}$ to 85°C ; typical values at $T_A = 30^{\circ}\text{C}$ and $V_{\text{REGIN}} = 3.6\text{ V}$ (unless otherwise noted) ⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{\text{IN(BAT)}}$ BAT pin voltage measurement range	Voltage divider enabled	2.45		4.5	V
$t_{\text{ADC_CONV}}$ Conversion time			125		ms
Effective resolution			15		bits

(1) Specified by design. Not tested in production.

5.10 Integrating ADC (Coulomb Counter) Characteristics

$T_A = -40^{\circ}\text{C}$ to 85°C ; typical values at $T_A = 30^{\circ}\text{C}$ and $V_{\text{REGIN}} = 3.6\text{ V}$ (unless otherwise noted) ⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{SR} Input voltage range from BAT to SRX pins			BAT \pm 25		mV
$t_{\text{SR_CONV}}$ Conversion time	Single conversion		1		s
Effective Resolution	Single conversion		16		bits

(1) Specified by design. Not tested in production.

5.11 Integrated Sense Resistor Characteristics, -40°C to 85°C

$T_A = -40^{\circ}\text{C}$ to 85°C ; typical values at $T_A = 30^{\circ}\text{C}$ and $V_{\text{REGIN}} = 3.6\text{ V}$ (unless otherwise noted) ⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
SRX_{RES} ⁽²⁾ Resistance of Integrated Sense Resistor from SRX to V_{SS}	$T_A = 30^{\circ}\text{C}$		7		$\text{m}\Omega$
I_{SRX} ⁽¹⁾ Recommended sense resistor input current.	Long term RMS, average device utilization			2000	mA
	Peak RMS current, 10% device utilization, -40°C to 70°C ⁽³⁾			3500	
	Peak RMS current, 10% device utilization, -40°C to 85°C ⁽³⁾			2500	mA
	Peak pulsed current, 250 ms max, 1% device utilization, -40°C to 70°C ⁽³⁾			4500	
	Peak pulsed current, 250 ms max, 1% device utilization, -40°C to 85°C ⁽³⁾			3500	mA

(1) Specified by design; not tested in production.

(2) Firmware compensation applied for temperature coefficient of resistor.

(3) Device utilization is the longterm usage profile at a specific condition compared to the average condition.

5.12 I²C-Compatible Interface Communication Timing Characteristics

$T_A = -40^{\circ}\text{C}$ to 85°C ; typical values at $T_A = 30^{\circ}\text{C}$ and $V_{\text{REGIN}} = 3.6\text{ V}$ (unless otherwise noted)

(1)

		MIN	NOM	MAX	UNIT
Standard Mode (100 kHz)					
$t_{\text{d(STA)}}$	Start to first falling edge of SCL	4			$\mu\text{ s}$
$t_{\text{w(L)}}$	SCL pulse duration (low)	4.7			$\mu\text{ s}$
$t_{\text{w(H)}}$	SCL pulse duration (high)	4			$\mu\text{ s}$
$t_{\text{su(STA)}}$	Setup for repeated start	4.7			$\mu\text{ s}$
$t_{\text{su(DAT)}}$	Data setup time	Host drives SDA	250		ns
$t_{\text{h(DAT)}}$	Data hold time	Host drives SDA	0		ns
$t_{\text{su(STOP)}}$	Setup time for stop	4			$\mu\text{ s}$
$t_{\text{(BUF)}}$	Bus free time between stop and start	Includes Command Waiting Time	66		$\mu\text{ s}$
t_{f}	SCL or SDA fall time ⁽¹⁾			300	ns
t_{r}	SCL or SDA rise time ⁽¹⁾			300	ns
f_{SCL}	Clock frequency ⁽²⁾			100	kHz
Fast Mode (400 kHz)					
$t_{\text{d(STA)}}$	Start to first falling edge of SCL	600			ns
$t_{\text{w(L)}}$	SCL pulse duration (low)	1300			ns
$t_{\text{w(H)}}$	SCL pulse duration (high)	600			ns
$t_{\text{su(STA)}}$	Setup for repeated start	600			ns
$t_{\text{su(DAT)}}$	Data setup time	Host drives SDA	100		ns
$t_{\text{h(DAT)}}$	Data hold time	Host drives SDA	0		ns
$t_{\text{su(STOP)}}$	Setup time for stop	600			ns
$t_{\text{(BUF)}}$	Bus free time between stop and start	Includes Command Waiting Time	66		$\mu\text{ s}$
t_{f}	SCL or SDA fall time ⁽¹⁾			300	ns
t_{r}	SCL or SDA rise time ⁽¹⁾			300	ns
f_{SCL}	Clock frequency ⁽²⁾			400	kHz

(1) Specified by design. Not production tested.

(2) If the clock frequency (f_{SCL}) is $> 100\text{ kHz}$, use 1-byte write commands for proper operation. All other transactions types are supported at 400 kHz. (See 节 6.3.1.1 and 节 6.3.1.3.)

6 Detailed Description

6.1 Overview

The BQ27427 fuel gauge accurately predicts the battery capacity and other operational characteristics of a single Li-based rechargeable cell. It can be interrogated by a system processor to provide cell information, such as state-of-charge (SOC).

备注

The following formatting conventions are used in this document:

Commands: *italics* with parentheses() and no breaking spaces, for example, *Control()*.

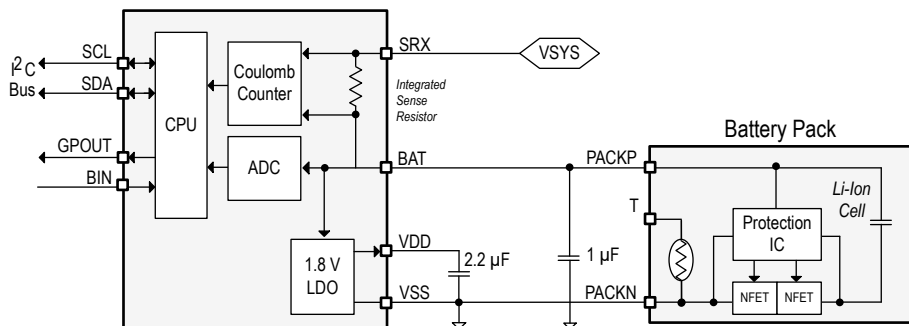

Data flash: *italics*, **bold**, and breaking spaces, for example, ***Design Capacity***.

Register bits and flags: *italics* with brackets [], for example, *[TDA]*

Data flash bits: *italics*, **bold**, and brackets [], for example, ***[LED1]***

Modes and states: ALL CAPITALS, for example, UNSEALED mode

6.2 Functional Block Diagram

6.3 Feature Description

Information is accessed through a series of commands, called *Standard Commands*. Further capabilities are provided by the additional *Extended Commands* set. Both sets of commands, indicated by the general format *Command()*, are used to read and write information contained within the control and status registers, as well as its data locations. Commands are sent from system to gauge using the I²C serial communications engine, and can be executed during application development, system manufacture, or end-equipment operation.

The key to the high-accuracy gas gauging prediction is Texas Instruments proprietary Impedance Track™ algorithm. This algorithm uses cell measurements, characteristics, and properties to create state-of-charge predictions that can achieve high accuracy across a wide variety of operating conditions and over the lifetime of the battery.

The fuel gauge measures the charging and discharging of the battery by monitoring the voltage across an integrated small-value sense resistor. When a cell is attached to the fuel gauge, cell impedance is computed based on cell current, cell open-circuit voltage (OCV), and cell voltage under loading conditions.

The fuel gauge uses an integrated temperature sensor for estimating cell temperature. Alternatively, the host processor can provide temperature data for the fuel gauge.

For more details, see the *BQ27427 Technical Reference Manual*.

6.3.1 Communications

6.3.1.1 I²C Interface

The fuel gauge supports the standard I²C read, incremental read, quick read, one-byte write, and incremental write functions. The 7-bit device address (ADDR) is the most significant 7 bits of the hex address and is fixed as 1010101. The first 8 bits of the I²C protocol are, therefore, 0xAA or 0xAB for write or read, respectively.

图 6-1. I²C Interface

The quick read returns data at the address indicated by the address pointer. The address pointer, a register internal to the I²C communication engine, increments whenever data is acknowledged by the fuel gauge or the I²C primary. “Quick writes” function in the same manner and are a convenient means of sending multiple bytes to consecutive command locations (such as two-byte commands that require two bytes of data).

The following command sequences are not supported:

图 6-2. Attempt To Write a Read-only Address (NACK After Data Sent By Primary)

图 6-3. Attempt To Read an Address Above 0x6B (NACK Command)

6.3.1.2 I²C Time Out

The I²C engine releases SDA and SCL if the I²C bus is held low for two seconds. If the fuel gauge is holding the lines, releasing them frees them for the primary to drive the lines. If an external condition is holding either of the lines low, the I²C engine enters the low-power SLEEP mode.

6.3.1.3 I²C Command Waiting Time

For proper operation at 400 kHz, a $t_{(BUF)} \geq 66 \mu s$ bus-free waiting time must be inserted between all packets addressed to the fuel gauge. In addition, if the SCL clock frequency (f_{SCL}) is > 100 kHz, use individual 1-byte write commands for proper data flow control. The following diagram shows the standard waiting time required between issuing the control subcommand the reading the status result. For read-write standard command, a minimum of 2 seconds is required to get the result updated. For read-only standard commands, there is no waiting time required, but the host must not issue any standard command more than two times per second. Otherwise, the gauge could result in a reset issue due to the expiration of the watchdog timer.

Waiting time inserted between two 1-byte write packets for a subcommand and reading results
(required for $100 \text{ kHz} < f_{\text{SCL}} \leq 400 \text{ kHz}$)

Waiting time inserted between incremental 2-byte write packet for a subcommand and reading results
(acceptable for $f_{\text{SCL}} \leq 100 \text{ kHz}$)

Waiting time inserted after incremental read

图 6-4. I²C Command Waiting Time

6.3.1.4 I²C Clock Stretching

A clock stretch can occur during all modes of fuel gauge operation. In SLEEP mode, a short $\leq 100\text{-}\mu\text{s}$ clock stretch occurs on all I²C traffic as the device must wake-up to process the packet. In the other modes (INITIALIZATION, NORMAL), a $\leq 4\text{-ms}$ clock stretching period may occur within packets addressed for the fuel gauge as the I²C interface performs normal data flow control.

6.4 Device Functional Modes

To minimize power consumption, the fuel gauge has several power modes:

- INITIALIZATION
- NORMAL
- SLEEP
- and SHUTDOWN

The fuel gauge passes automatically between these modes, depending upon the occurrence of specific events, though a system processor can initiate some of these modes directly. For more details, see the *BQ27427 Technical Reference Manual*.

7 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

The BQ27427 fuel gauge is a microcontroller peripheral that provides system-side fuel gauging for single-cell Li-Ion batteries. Battery fuel gauging with the fuel gauge requires connections only to PACK+ and PACK- for a removable battery pack or embedded battery circuit. To allow for optimal performance in the end application, special considerations must be taken to ensure minimization of measurement error through proper printed circuit board (PCB) board layout. Such requirements are detailed in 节 7.2.1.

7.2 Typical Applications

The BQ27427 device can be used without current sense resistor (as shown in the schematic below).

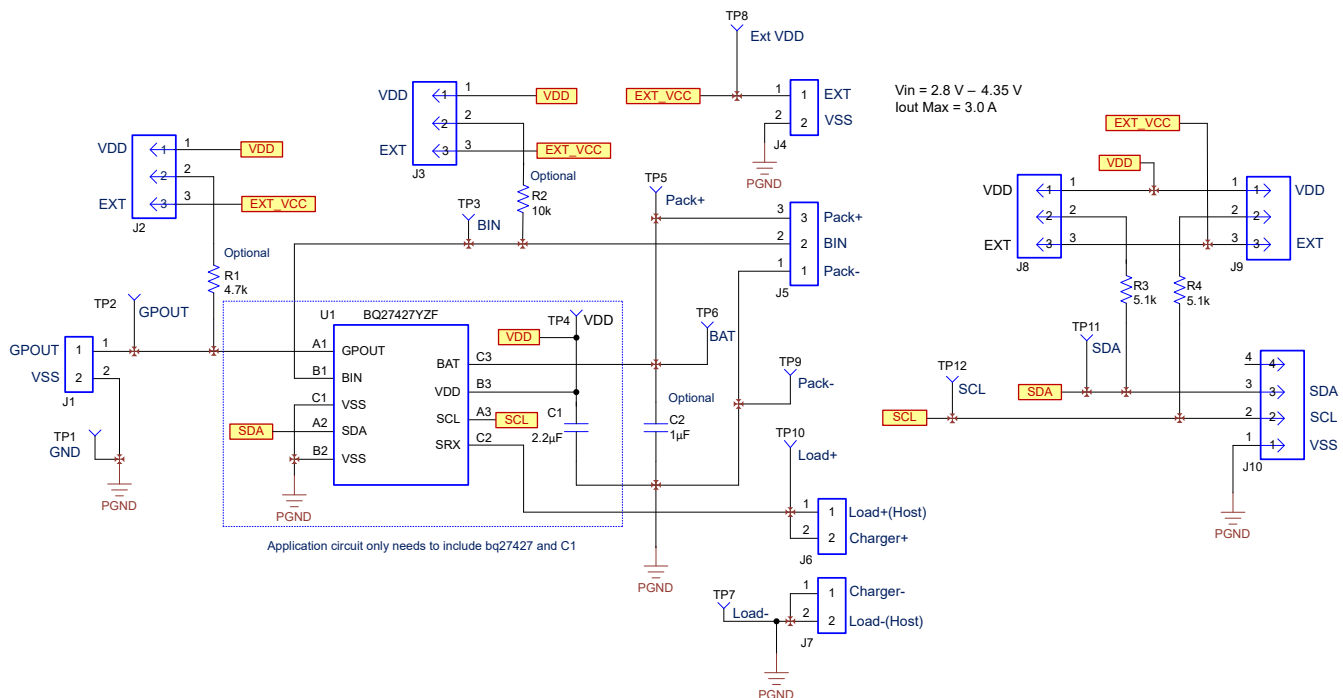

图 7-1. Typical Application with High-Side Current Sense Resistor

7.2.1 Design Requirements

As shipped from the Texas Instruments factory, the BQ27427 fuel gauge comes with three preprogrammed chemistry profiles and gauging parameters in ROM. Upon device reset, the contents of ROM are copied to associated volatile RAM-based data memory blocks. For proper operation, all parameters in RAM-based data memory require initialization. This can be done by updating data memory parameters in a lab/evaluation situation or by downloading the parameters from a host. The *BQ27427 Technical Reference Manual* shows the default and typically expected values appropriate for most applications.

7.2.2 Detailed Design Procedure

7.2.2.1 BAT Voltage Sense Input

A ceramic capacitor at the input to the BAT pin is used to bypass AC voltage ripple to ground, greatly reducing its influence on battery voltage measurements. It proves most effective in applications with load profiles that exhibit high-frequency current pulses (that is, cell phones) but is recommended for use in all applications to reduce noise on this sensitive high-impedance measurement node.

7.2.2.2 Integrated LDO Capacitor

The fuel gauge has an integrated LDO with an output on the V_{DD} pin of approximately 1.8 V. A capacitor of value at least 2.2 μ F should be connected between the V_{DD} pin and V_{SS} . The capacitor must be placed close to the gauge IC and have short traces to both the V_{DD} pin and V_{SS} . This regulator must not be used to provide power for other devices in the system.

7.2.3 External Thermistor Support

The fuel gauge temperature sensing circuitry is designed to work with a negative temperature coefficient-type (NTC) thermistor with a characteristic 10-k Ω resistance at room temperature (25°C). The default curve-fitting coefficients configured in the fuel gauge specifically assume a Semitec 103AT type thermistor profile and so that is the default recommendation for thermistor selection purposes. Moving to a separate thermistor resistance profile (for example, JT-2 or others) requires an update to the default thermistor coefficients which can be modified in RAM for the highest accuracy temperature measurement performance.

7.2.4 Application Curves

图 7-2. Voltage Accuracy Error

图 7-3. Internal Temperature Accuracy Error

图 7-4. Current Accuracy Error

8 Power Supply Recommendation

8.1 Power Supply Decoupling

The battery connection on the BAT pin is used for two purposes:

- To supply power to the fuel gauge
- To provide an input for voltage measurement of the battery.

Connect a capacitor of value of at least 1 μF between BAT and V_{SS} . Place the capacitor close to the gauge IC and have short traces to both the BAT pin and V_{SS} .

The fuel gauge has an integrated LDO with an output on the V_{DD} pin of approximately 1.8 V. Connect a capacitor of value at least 2.2 μF between the V_{DD} pin and V_{SS} . Place the capacitor close to the gauge IC and have short traces to both the V_{DD} pin and V_{SS} . Do not use this regulator to provide power for other devices in the system.

9 Layout

9.1 Layout Guidelines

- A capacitor of a value of at least 2.2 μF is connected between the V_{DD} pin and V_{SS} . The capacitor should be placed close to the gauge IC and have short traces to both the V_{DD} pin and V_{SS} . This regulator must not be used to provide power for other devices in the system.
- It is required to have a capacitor of at least 1.0 μF connect between the BAT pin and V_{SS} if the connection between the battery pack and the gauge BAT pin has the potential to pick up noise. The capacitor should be placed close to the gauge IC and have short traces to both the V_{DD} pin and V_{SS} .
- If the external pullup resistors on the SCL and SDA lines will be disconnected from the host during low-power operation, it is recommended to use external 1-M Ω pulldown resistors to V_{SS} to avoid floating inputs to the I²C engine.
- The value of the SCL and SDA pullup resistors should take into consideration the pullup voltage and the bus capacitance. Some recommended values, assuming a bus capacitance of 10 pF, can be seen in 表 9-1.

表 9-1. Recommended Values for SCL and SDA Pullup Resistors

VPU	1.8 V		3.3 V	
R_{PU}	Range	Typical	Range	Typical
	$400\ \Omega \leq R_{PU} \leq 37.6\ \text{k}\Omega$	10 k Ω	$900\ \Omega \leq R_{PU} \leq 29.2\ \text{k}\Omega$	5.1 k Ω

- If the host is not using the GPOUT functionality, then it is recommended that GPOUT be connected to a GPIO of the host so that in cases where the device is in SHUTDOWN, toggling GPOUT can wake the gauge up from the SHUTDOWN state.
- If the battery pack thermistor is not connected to the BIN pin, the BIN pin should be pulled down to V_{SS} with a 10-k Ω resistor.
- The BIN pin should not be shorted directly to V_{DD} or V_{SS} .
- The actual device ground is pin 3 (V_{SS}).
- Kelvin connects the BAT pin to the battery PACKP terminal.

- [Single Cell Gas Gauge Circuit Design](#)
- [Single Cell Impedance Track Printed-Circuit Board Layout Guide](#)
- [ESD and RF Mitigation in Handheld Battery Electronics](#)

10.2 Trademarks

Impedance Track™ and NanoFree™ are trademarks of Texas Instruments.
所有商标均为其各自所有者的财产。

10.3 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

10.4 术语表

[TI 术语表](#) 本术语表列出并解释了术语、首字母缩略词和定义。

11 Revision History

注：以前版本的页码可能与当前版本的页码不同

Changes from Revision * (December 2022) to Revision A (October 2023)	Page
• Updated Typical Applications	13
• Changed the LDO output capacitor value from 0.47 μ F to 2.2 μ F in Power Supply Decoupling	15

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
BQ27427YZFR	ACTIVE	DSBGA	YZF	9	3000	RoHS & Green	SNAGCU	Level-1-260C-UNLIM	-40 to 85	BQ27427	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
